C++ Object-Oriented Program & Use Case Diagram	C++ Object-Oriented Program and Use Case Diagram meet specified Requirements.	Output files, solution1.txt, solution2.txt, solution3.txt, solution4.txt, and solution5.txt, are correct; algorithm is recursive and object-oriented; Use Case Diagram contains the required level of detail: 1) Identify a use case, 2) Provide a brief description for the use case, 3) Provide a step-by-step flow (outline) of the events for the use case, and 4) Provide a detailed description for the use case; and GitHub shows the code was modified and not over-written.	30	Algorithm is recursive and object-oriented, but one or more output files are incorrect or the Use Case Diagram does not contain the required level of detail.	15	Algorithm is not recursive and object-oriented or program does not execute or no Use Case Diagram is provided or the student did not modify another student's code.	0	30
GenAI Analysis - Program & Access	a. Name of two GenAI programs b. How you accessed them (e.g., Google query, CoPilot on my computer)	Names both GenAI programs and clearly details how each was accessed.	4	Misses one program name or fails to explain the access method.	2	Fails to provide names or access info for either program.	0	4
GenAI Analysis - Prompt & Raw Code	c. Prompt used. (You must use the same prompt for both GenAIs.) d. Generated code from both GenAIs.	Uses the exact same prompt for both. Includes the complete, raw code from both.	6	Prompts differ slightly, or code snippet from one program is missing/incomplete.	3	Different prompts used and raw code is missing.	0	6
GenAI Analysis - Code Analysis	e. Analyze the code in terms of correctness, execution time, space complexity, and maintainability as explained in the “GenAI Code Comparison” lecture.	Deeply analyzes both codes across correctness, time, space, and maintainability.	10	Analysis is surface-level or skips 1–2 of the required lecture metrics.	5	No analysis, or vague analysis that ignores the required lecture metrics.	0	10
GenAI Analysis - Selection & Justification	f. Select one to use as the basis for this assignment and justify why you picked it.	Clearly selects one program and provides a strong, data-backed justification.	5	Selects a program, but the justification is weak or lacks connection to the analysis.	3	No baseline program selected or no justification given.	0	5
GenAI Analysis - Code Improvement	g. Explain what you did to improve it in terms of correctness, execution time, space complexity, and maintainability.	Clearly details code modifications and thoroughly explains the resulting metric upgrades.	10	Modifications are vague, or fails to connect changes to specific metric improvements.	5	Code was not improved, or the explanation of changes is missing.	0	10
Prolog Comments	Prolog comments include program name, brief description of the program, inputs, output, collaborators, author's full name, and creation/revision date.	Everything is included	7	1 or 2 items are missing	4	More than 2 items are missing	0	7
In-Line Comments	Adequate comments summarizing major blocks of code and comments on every line.	Every line is commented or multi-line comments are detailed enough that it is clear what each line of code is doing.	14	Some lines are commented, or comments are not very descriptive.	7	Few lines are commented	0	14
Collaborators	Collaborator's contributions are identified in comments	Collaborator's contributions are identified adequately in the code; if an internet source is used (e.g., stackOverlow) the URL is given; and if collaborator is another person, the person is identified. (You are not required to identify your own code copied from other programs).	14	Collaborators are identified and it is clear what part of the code they collaborated on, but the internet URL is not given or the person is not identified.	7	Otherwise	0	14
